

non-custodial payouts for agencies

# Pay everyone in one transfer.

Your money never touches our hands. Your data never leaves your machine.

Banks won't touch your business, so payroll falls to you — a spreadsheet, the split math, wallet addresses copied one at a time. One mistyped character and the money is simply gone: no reversal, no support line. Purser handles the arithmetic, checks every address, and hands you a single batch to sign from your own wallet.

the problem

## Payday shouldn't be the most nerve-wracking hour of your month.

You run an agency, not a treasury desk. Yet every month you become the accountant, the data-entry clerk, and the last line of defence — all before a single person is paid.

01

### The monthly rebuild

A fresh spreadsheet every month, formulas held together by memory. Drag one cell wrong and someone is short — or paid twice.

02

### The split math

Seventy-thirty splits, bonuses, chargebacks, the one chatter on a bespoke rate. All reconciled by hand, usually late, usually tired.

03

### One typo, gone

A TRC20 address is thirty-four characters of nothing. Send to the wrong one and there's no reversal, no refund, and no one to call.

04

### Hours you don't have

Two or three hours every payday spent copying and re-checking — hours that belong to running the business.

how it works

## Three steps. Then you're done.

1

### Load your team

Import a CSV or enter them by hand — names, wallets, splits. Purser keeps the roster, so next month begins where this one left off.

2

### We build & check the batch

Every address validated on TRON, returning payees matched against last month, all splits and totals computed. Nothing to commit to until it's right.

3

### You sign. Once.

Connect your wallet, review the batch, and sign a single time. The funds move straight from you to your team. **You sign, not us.**

the moat

## Your keys. Your wallet. Your money.

Non-custodial is a plain idea: we never hold your funds, and we never hold your keys. Purser handles the part that keeps you up at night — the arithmetic and the address-checking — then hands you an unsigned batch. You sign it with your own wallet, and the money moves from you to your team. It never passes through us, because by design it can't.

your wallet

### Funds sit here

Under your control, start to finish.

→

purser

### Builds the batch

Checks every address. Computes every split.

No funds pass through

→

you sign

### One signature

Your wallet, straight to the team.

→

team wallets

### Everyone paid

Nothing detoured. Nothing held back.

what you get

## Six things that make payday boring.

### Whole payroll, one signature

Approve fifty people with a single signature, instead of sending fifty transactions by hand.

### Address double-check

✓ Valid on TRON. ✓ Paid before, and matches last month. The costly typo is caught long before it goes out.

### A roster that remembers

Rates, splits and wallets set once and adjusted whenever. Each month resumes where you left off — never a blank sheet.

### CSV import

Bring the sheet you already keep. Map the columns once and you're ready — no rebuilding from scratch.

### Receipts that hold up

A PDF receipt for every run, each line linked to Tronscan. Clean books, clear proof of payment, no disputes.

### TRON / USDt native

TRC20 USDt, end to end — the same rail your team is already paid on, without the friction.

pricing

## One flat price. However much you move.

Custodial services take **0.5–3.5% of volume**. Move \$50k a month and that's **\$250–\$1,750** — every month, and it grows exactly as you do.

**A flat fee wins the moment you're serious.** You pay the same whether you move \$5k or \$500k.

purser pay · everything included

€249 / month  
or €2,490/year — two months free. Lock it in.

- ✓ Unlimited payouts & recipients
- ✓ No per-transaction or volume fees
- ✓ Address double-check & batch builder
- ✓ PDF receipts with Tronscan links
- ✓ Non-custodial, always — you sign

straight answers

## Questions, answered plainly.

### Do you hold my funds?

No — and it isn't a matter of trust. Purser is non-custodial: we build the batch, you sign it with your own wallet, and the funds go straight to your team. They never enter an account we control, so touching them simply isn't something we can do.

### Is this legal for me to use?

### What wallets work?

### What if I send to a wrong address?

### Which chains and tokens?

### Is my team's data private?

a calmer payday

## Pay everyone in one transfer.

We do the arithmetic. We check every address. We hand you the batch. You sign — and the money never touches our hands.
